

Feedback on SushruthaSetu – FHIR App Challenge Submission

Hi Santosh,

First off, congratulations. What you built in 15 days is genuinely impressive.

SushruthaSetu is a substantial piece of work.

What stood out

A lot of the decisions here show good healthcare instincts.

One of the strongest is the focus on information fragmentation. Clinicians spend a significant amount of time gathering information before a visit. Bringing problems, medications, allergies, labs, vitals, visits, and notes into a single place addresses a real pain point, and framing the experience around visit preparation is a good use case to begin with.

The AI pre-visit summary is another highlight. Pulling out the most important information before an encounter helps reduce cognitive load and creates a clearer starting point for the visit.

The recommendation engine shows similar thoughtfulness. Suggestions are organized, contextual, and grounded in existing patient information. Small details like avoiding recommendations for medications that have already been prescribed, make it feel like you were thinking about clinical workflow rather than simply generating text. Good job there.

The care gaps feature reflects a good understanding of proactive care. Looking for overdue follow-up, preventive care, or missing monitoring shows an appreciation for the work that happens between visits and outside individual encounters.

Small touches like voice dictation support add up well to the overall experience too.

And underneath all of that, the engineering foundation feels solid. The app is well structured, FHIR-native, and deployable. We are quite impressed by it!

A meaningful opportunity

The most memorable healthcare products are built around a very specific and clearly defined problem.

Right now, SushruthaSetu does a good job of helping someone understand everything about a patient. It's broad, capable, and covers a lot of ground.

The opportunity is deciding whether there's a particular piece of clinical work you want to become exceptionally good at. When a product has that kind of focus, it becomes much easier to decide what information deserves attention, what actions matter most, and what success looks like. A clear center of gravity can make the entire experience feel more cohesive and purposeful.

Clinical usability

Several improvements can be made from a workflow perspective.

For example, the patient view surfaces a lot of useful information, but many sections have roughly the same visual importance. As a result, the clinician still has to answer the question of what matters most right now. So maybe, additional guidance around what deserves attention during the current visit could help clinicians orient themselves more quickly.

The care gaps and AI recommendations already do a good job of identifying opportunities. Creating pathways for users to act on those opportunities directly within the workflow could make them even more valuable.

The same idea applies to workflow. Much of the experience currently supports preparation before a visit, which is already useful. There may be opportunities to think more broadly about what happens before, during, and after an encounter, and how the product can support that entire journey.

And while the presentation of labs and vitals is already well done, there's room to move beyond displaying information toward helping interpret it within the context of the patient's broader clinical picture.

Where you could take it next

The biggest opportunity is choosing a lane and going deeper. That lane could be defined by a particular type of clinician, a patient population, a recurring clinical challenge, or a workflow that currently falls through the cracks. The exact choice matters less than committing to it.

Once you have that focus, the app can become more opinionated about what deserves attention, what actions should be taken, who is responsible, and what outcome it's trying to improve.

Small improvements worth considering

- Make at least one recommendation directly actionable inside the product.
- Deepen the reasoning you already surface for care gaps and recommendations — e.g. cite the guideline or threshold behind a flag, not just the trigger.
- One small navigation issue we noticed: after using "Back to Patient Hub" from a Clinical Detail page, the next "Back" action returns to the detail page again rather than the patient list, creating a bit of a loop between the two screens. Giving each Back button an explicit destination instead of relying on browser history should make the flow feel smoother.

SushruthaSetu already demonstrates a lot of strengths. The exciting part now is deciding where you want to take it, what story you want the product to tell, and how deeply you want to explore that direction.

Really nice work, and we'd love to see where you take it next.
